

PROJECT LEAD THE WAY

PLTW

Igniting imagination and innovation through learning.

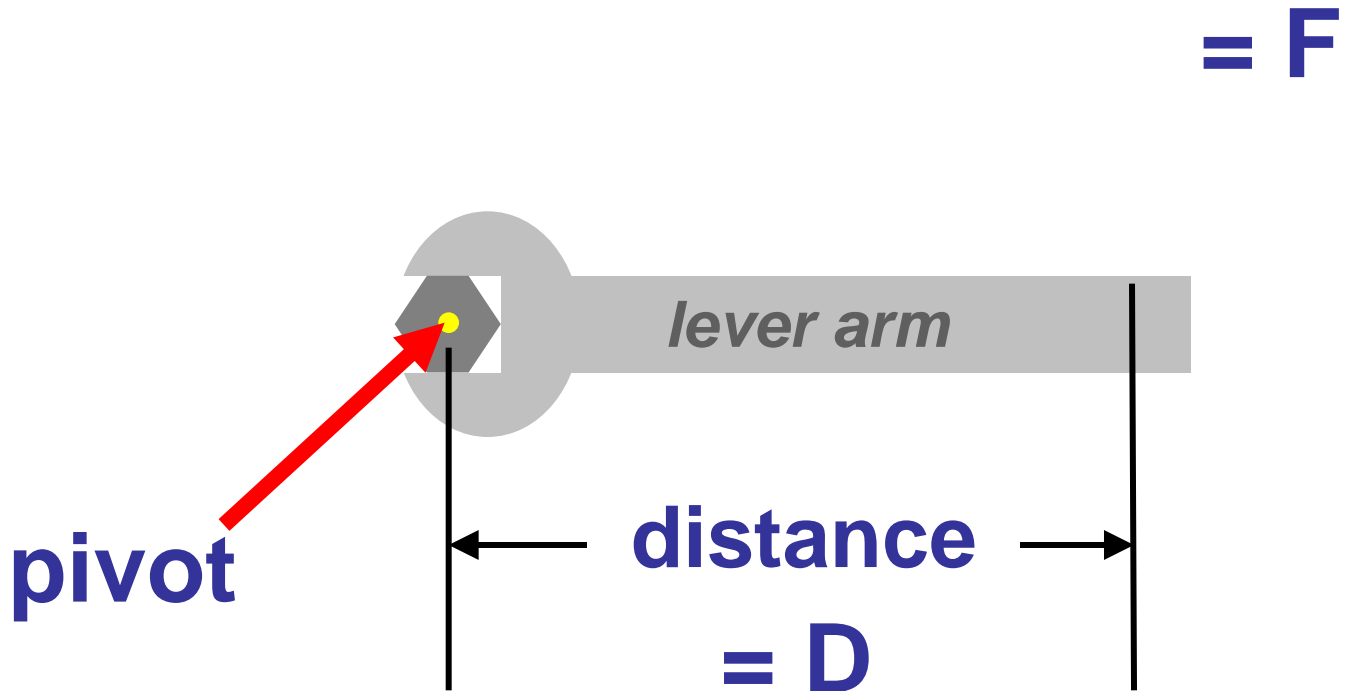

Moments

Moment

The *moment* of a force is a measure of the tendency of the force to **rotate** the body upon which it acts.

Terminology

The distance must be perpendicular to the force.

Moments Formula

$$\text{Moment} = F \times D$$

Units for Moments

	Force	Distance	Moment
English Customary	Pound force (lbf)	Foot (ft)	<u>lb-ft</u>
SI	Newton (N)	Meter (m)	<u>N-m</u>

Rotation Direction

In order to add moments, it is important to know if the direction is clockwise (CW) or counterclockwise (CCW).

CCW is positive.

CW is negative.

Right-Hand Rule

Curl your fingers to match the direction of rotation.

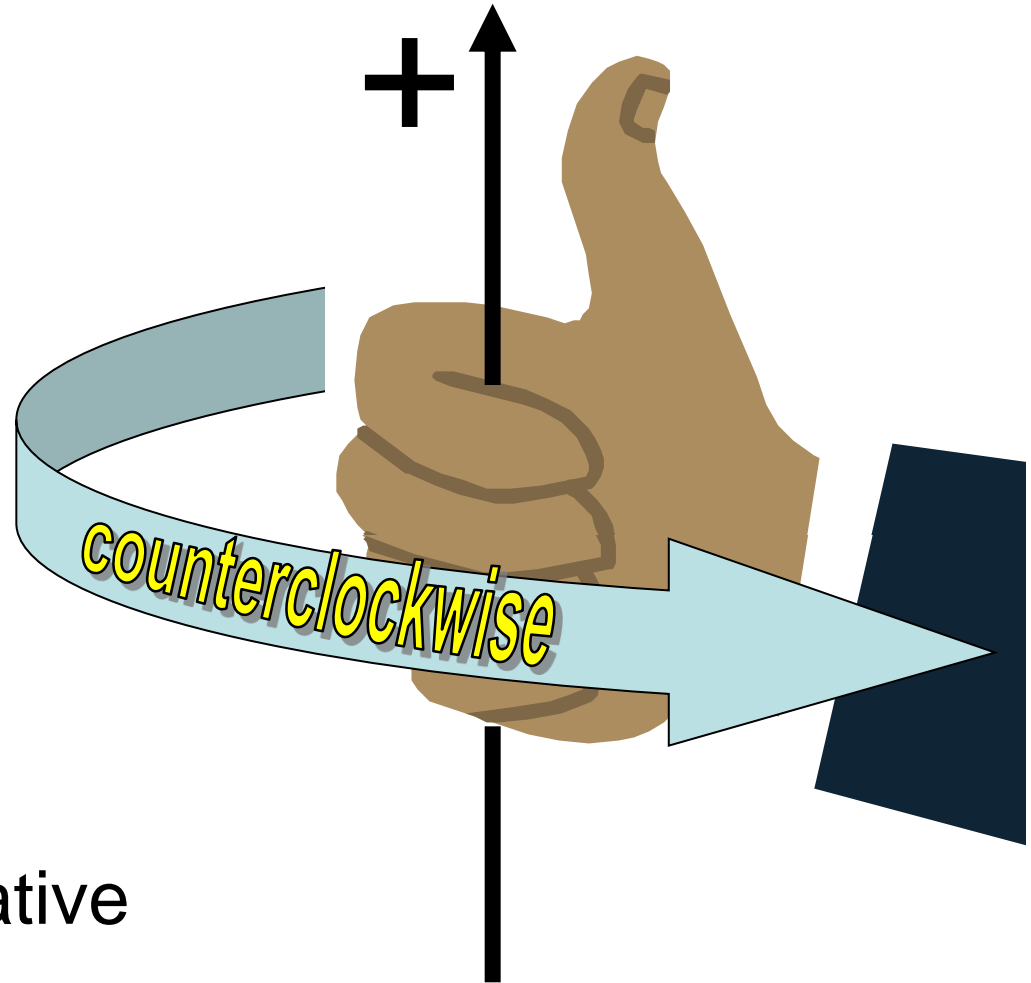

Thumb is pointing

Up = Positive

Down = Negative

Toward You = Positive

Away from You = Negative

Right-Hand Rule

**THUMB
POINTS
TOWARD
YOU**

Right-Hand Rule

NEGATIVE

Moment Calculations

Wrench

$$M = -(F \times D)$$

Use the right-hand rule to determine positive and negative.

$$D = 9.0 \text{ in.} = .75 \text{ ft}$$

$$M = -(20. \text{ lb} \times .75 \text{ ft})$$

$$M = \underline{-15 \text{ lb-ft}}$$

(15 lb-ft clockwise)

Moment Calculations

Longer Wrench

$$M = -(F \times D)$$

$$M = -(20. \text{ lb} \times 1.0 \text{ ft})$$

$$M = \underline{\underline{-20. \text{ lb-ft}}}$$

Moment Calculations

L - Shaped Wrench

$$D = 3 \text{ in.} = \underline{.25} \text{ ft}$$

$$M = -(F \times D)$$

$$M = -(20. \text{ lb} \times \underline{.25} \text{ ft})$$

$$M = \underline{-5 \text{ lb-ft}}$$

Moment Calculations

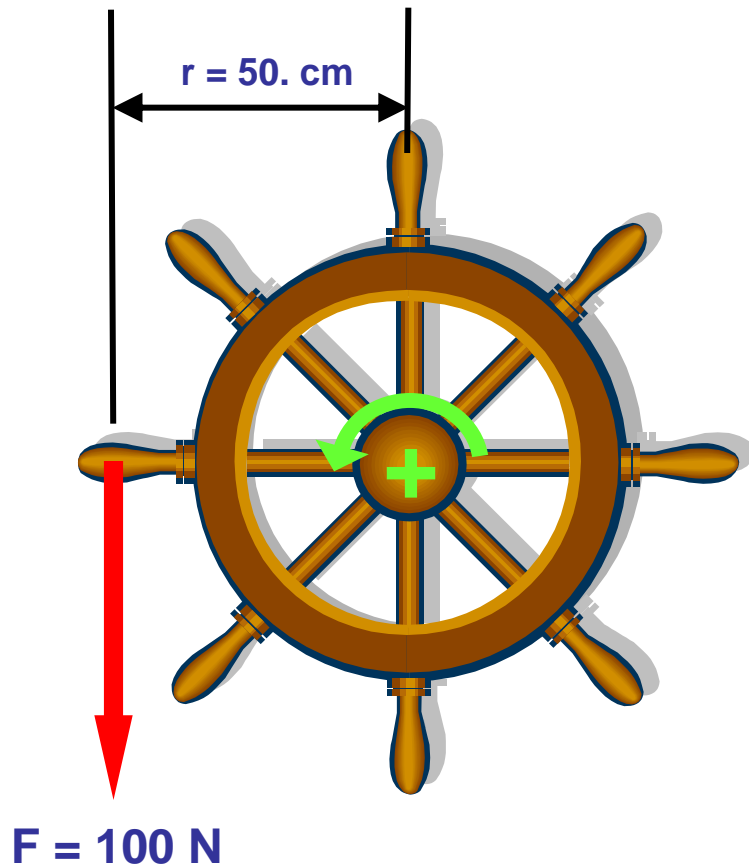

Z - Shaped Wrench

$F = 20. \text{ lb}$

Moment Calculations

Wheel and Axle

$$D = r = 50. \text{ cm} = 0.50 \text{ m}$$

$$M = F \times D$$

Use the right-hand rule to determine positive and negative.

$$M = 100 \text{ N} \times 0.50 \text{ m}$$

$$M = \underline{50 \text{ N-m}}$$

Moment Calculations

Wheel and Axle

$$F_y = F \sin 50.^\circ = (100. \text{ N})(.7660)$$

$$F_y = 76.60 \text{ N}$$

$$D = r = 50. \text{ cm} = 0.50 \text{ m}$$

$$M = F_y \times D$$

$$M = 76.60 \text{ N} \times 0.50 \text{ m}$$

$$M = \underline{38 \text{ N-m}}$$

What is Equilibrium?

The state of a body or physical system with an unchanging rotational motion.

- Two cases for that condition:
 1. Object is not rotating.
 2. Object is spinning at the same speed.
- In either case rotation forces are balanced.

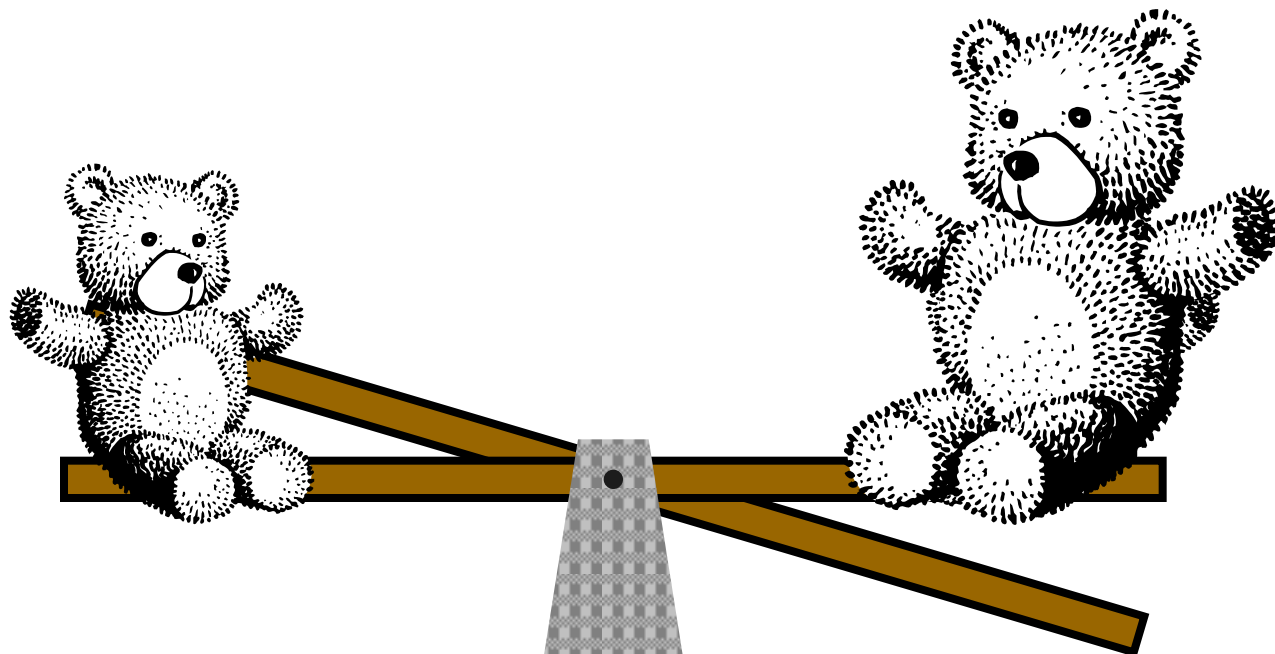

The sum of all moments about any point or axis is zero.

$$\Sigma M = 0$$

$$M_1 + M_2 + M_3 \dots = 0$$

Moment Calculations

See-Saw

Moment Calculations

See-Saw

$$\Sigma M = 0$$

$$M_1 + (-M_2) = 0$$

Use the right-hand rule to determine positive and negative.

$$M_1 = M_2$$

$$F_1 \times D_1 = F_2 \times D_2$$

$$25 \text{ lb} \times 4.0 \text{ ft} = 40 \text{ lb} \times D_2$$

$$\frac{100 \cancel{\text{lb}}\text{-ft}}{40 \cancel{\text{lb}}} = \frac{40 \cancel{\text{lb}} \times D_2}{40 \cancel{\text{lb}}}$$

$$D_2 = \underline{2.5 \text{ ft}}$$

Moment Calculations

Loaded Beam

Select A as the pivot location. Solve for R_{By}

$$\Sigma M = 0$$

$$M_B + (-M_C) = 0$$

$$M_B = M_C$$

$$R_{By} \times D_{AB} = F_C \times D_{AC}$$

$$R_{By} \times 10.00 \text{ ft} = 35.0 \text{ lb} \times 3.00 \text{ ft}$$

$$R_{By} \times \cancel{10.00 \text{ ft}} = \frac{105 \text{ lb-ft}}{\cancel{10.00 \text{ ft}}}$$

$$R_{By} = 10.5 \text{ lb}$$

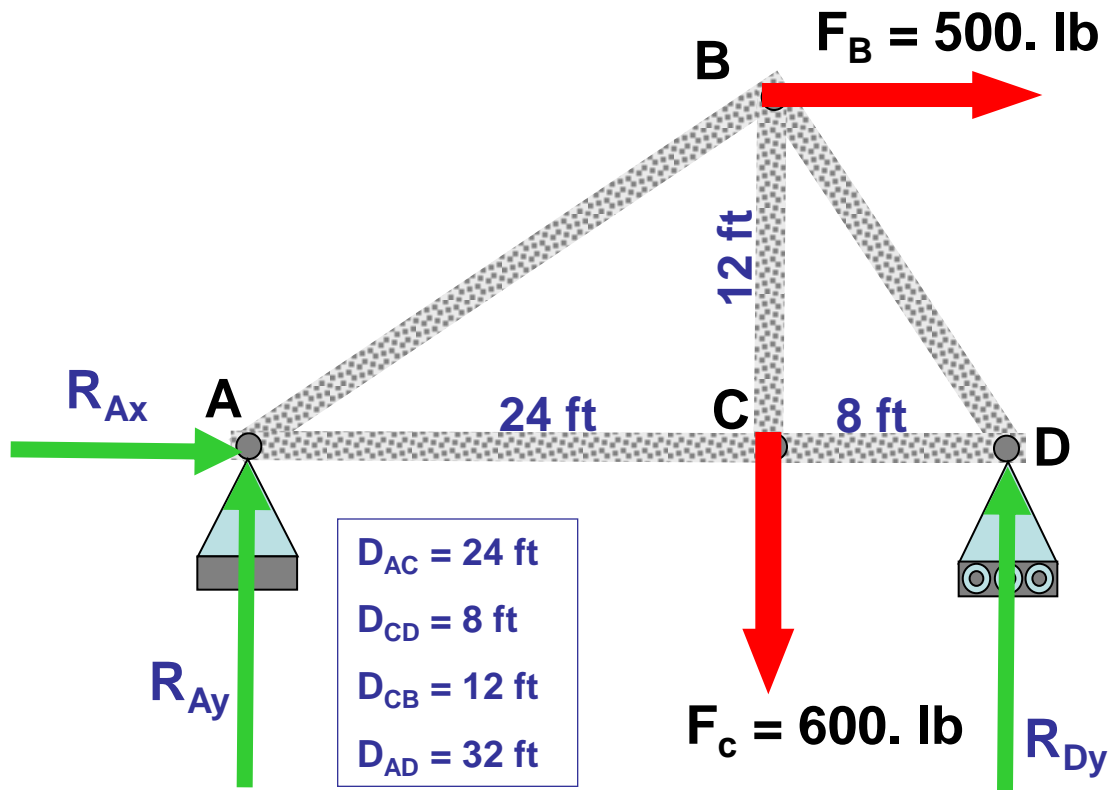

$$R_{Ay} + R_{By} = 35.0 \text{ lb}$$

$$R_{Ay} = 35.0 \text{ lb} - 10.5 \text{ lb} =$$

$$\underline{24.5 \text{ lb}}$$

Moment Calculations

Truss

Replace the pinned and roller supports with reaction forces.

Moment Calculations

Truss

Select A as the axis of rotation. Solve for R_{Dy}

$$\Sigma M = 0$$

$$M_D - M_B - M_C = 0$$

$$M_D = M_B + M_C$$

$$R_{Dy} \times D_{AD} = (F_B \times D_{CB}) + (F_C \times D_{AC})$$

$$R_{Dy} \times 32 \text{ ft} = (500. \text{ lb} \times 12 \text{ ft}) + (600. \text{ lb} \times 24 \text{ ft})$$

$$R_{Dy} \times 32 \text{ ft} = 6000 \text{ lb-ft} + 14400 \text{ lb-ft}$$

$$\cancel{R_{Dy} \times 32 \text{ ft}} = \frac{20400 \text{ lb-ft}}{\cancel{32 \text{ ft}}}$$

$$R_{Dy} = \underline{640 \text{ lb}}$$
